A conversion lift worth investigating

E-commerce A/B testing
and regression analysis

Treatment conversion is higher

Control: 3,650 / 34,678 Treatment: 5,469 / 35,211

+5.01 pp

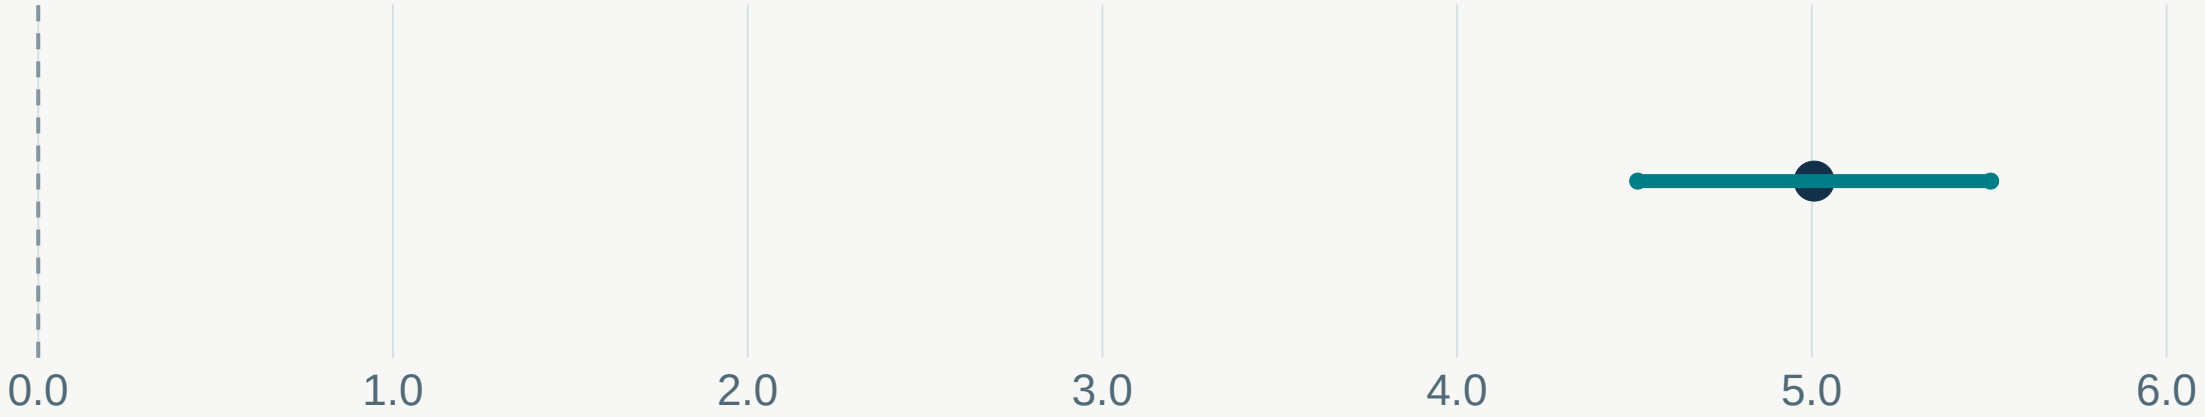

Absolute difference

+47.57%

Relative lift

The effect interval excludes zero

Treatment minus control conversion, in percentage points

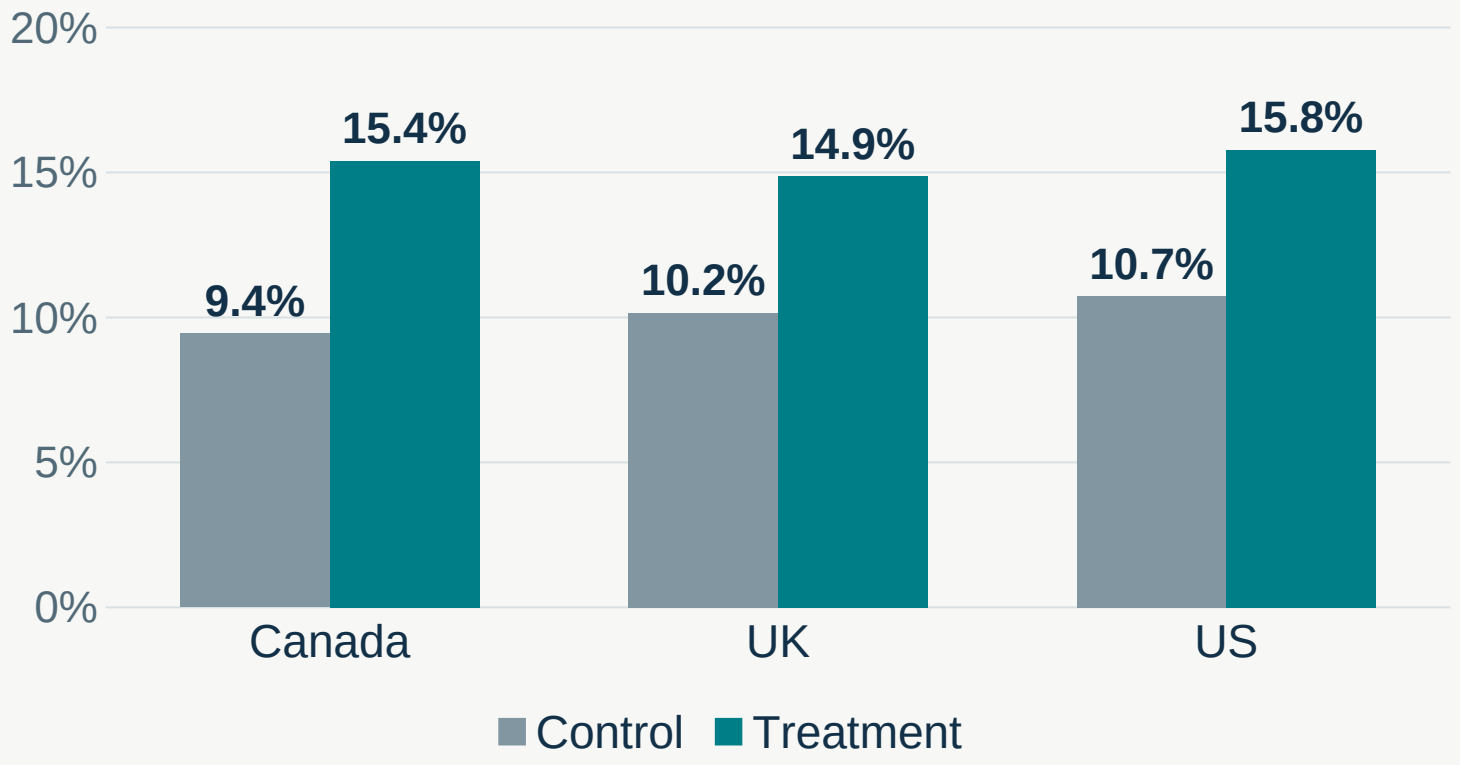

95% Newcombe CI: 4.5092 to 5.5042 pp

Two-sided pooled test: $p = 6.104 \times 10^{-86}$

Independent observations assumed. Significance threshold 0.05 chosen retrospectively.

Country adjustment changes little

Conversion by country and assigned group

Treatment odds ratio

1.56314

Unadjusted

1.56302

Adjusted for country

Standardized difference: 5.00524 pp, point estimate only

Data quality has a clear boundary

69,889

rows in the source file

0

missing values in the three fields

Available

Country, group and conversion
Repeated categorical tuples retained

Not available

User IDs, timestamps or
verified randomization details

Intended allocation unknown. If 50:50, p = 0.0442 prompts a design check.

Business readiness remains unmeasured

Evidence favors treatment under the stated assumptions

Experiment validity

Verify allocation, observation units, test timing and event logging.

Decision criteria

Define a worthwhile effect and guardrails before a rollout.

The file contains no revenue, cost or ROI evidence.
